Table of Contents

0 Hints

1 React basics and JSX

1.1 Intro

1.1 Setup Tailwind and Daisy UI

1.1.1 Tailwind

First of all you need to create a new project

CLI=> *npx create-react-app github-finder --use-npm*

Go to the new folder (github-finder)

CLI=> *npm install -D tailwindcss postcss autoprefixer*

CLI=> *npx tailwindcss init -p*

Open file **tailwind.config.js** and paste

```
/** @type {import('tailwindcss').Config} */
module.exports = {
  content: [
    "./src/**/*.{js,jsx,ts,tsx}",
  ],
  theme: {
    extend: {},
  },
  plugins: [],
}
```

Open **index.css**

```
@tailwind base;
@tailwind components;
@tailwind utilities;
```

1.1.2 Daisy UI

CLI=> *npm i daisyui*

Open file **tailwind.config.js**

```
plugins: [require('daisyui')],
```

Now you can start your react app using npm start.

Change main component App.js => App.jsx (to be able to work with tag plugin)
